PROTECTING GROUPS IN ORGANIC SYNTHESIS
Selective functionalization of poly-functional molecules is an important and desirable attribute in multi-step organic synthesis.

**Challenges in Organic Synthesis**

**Chemoselective Oxidation**

Selecting the right reagent is crucial for achieving chemoselectivity in oxidation reactions. For instance, using silver oxide ($\text{Ag}_2\text{O}$) as an oxidizing agent can selectively oxidize the hydroxyl group to a carboxyl group, whereas chromic acid ($\text{CrO}_3$) can lead to non-selective oxidation of alcohols to carboxylic acids along with other functionalities. This highlights the importance of understanding the reagents and conditions involved in organic synthesis to achieve desired functionalization.
Note, however, that each protecting group incorporated in a multi-step synthesis increases the synthesis by two non-productive steps reducing the overall yield and efficiency of the synthesis.
A protecting group (PG) is a molecular framework that is introduced onto a specific functional group (FG) in a poly-functional molecule to block its reactivity under reaction conditions needed to make modifications elsewhere in the molecule.
Qualities of a Good Protecting Group in Organic Synthesis

A good protecting group should be such that:

(a) It should be readily, but selectively introduced to the desired functional group in a poly-functional molecule.

(b) It should be stable / resistant to the reagents employed in subsequent reaction steps in which the group being masked (protected) is desired to remain deactivated (protected).

(c) It should be capable of being selectively removed under mild conditions when its protection is no longer required.
The commonly encountered functional groups in organic synthesis that are reactive to nucleophilic or electrophilic reagents whose selective transformation may present challenges do regularly require deactivation by masking with a protecting group.
Protecting Groups for Alcohols

The common protecting groups for alcohols are ether-protecting groups. Ethers are among the least reactive of the organic functional groups.

\[
\begin{align*}
R-\text{OH} & \quad \xrightarrow{\text{R-O-R,}} & \quad R-\text{O-R,} \\
\text{Alcohols} & & \text{Ether}
\end{align*}
\]

The ether protecting groups of alcohols can be grouped in the following categories:

(a) Silyl ether protecting groups

\[
\begin{align*}
R-\text{OH} & \quad \xrightarrow{\text{R-O-Si-R,}} & \quad R-\text{O-Si-R,} \\
\text{Alcohol} & & \text{Silyl Ether}
\end{align*}
\]

(b) Acetal protecting groups

\[
\begin{align*}
R-\text{OH} & \quad \xrightarrow{\text{R-CH}_2\text{O-R,}} & \quad R-\text{OCH}_2\text{O-R,} \\
\text{Alcohol} & & \text{Acetal}
\end{align*}
\]

These protections replace the acidic proton on an alcohol with an unreactive ether moiety.
Protecting Groups for Alcohols

**Common Silicon-Based Protecting Groups for Alcohols**

\[
\begin{align*}
\text{Trimethylsilyl} & : & \text{CH}_3 \quad \text{CH}_3 \\
\text{Triethylsilyl} & : & \text{CH}_2\text{CH}_3 \quad \text{CH}_2\text{CH}_3 \\
\text{Tert-Butyldimethylsilyl (TBDMS)} & : & \text{CH}_3 \quad \text{CH}_3 \\
\text{Tert-Butyldiphenylsilyl (TBDPS)} & : & \text{Ph} \quad \text{CH}_3 \\
\end{align*}
\]

**Formation**

**Silicon-Based Protecting Groups for Alcohols**

\[
\text{R-OH} + \text{R'}_3\text{Si-X} \xrightarrow{\text{Base}} \text{R-OSiR'}_3
\]

\(x = \text{Cl or OTf}\)

**Bases**

- \(\text{Et}_3\text{N / DMAP}\)
- \(\text{Pyridine / DMAP}\)
- \(\text{2,6-Lutidine}\)
- \(\text{Imidazole}\)
Protecting Groups for Alcohols

*Tert*-Butyldimethylsilyl ethers (TBDMS)

\[ R-OH \xrightarrow{\text{TBDMSCl, Imidazole}} R-\overline{\text{O-Si-C-\text{CH}_3}} \]

Example

- **Example 1:**
  \[ \text{Cyclohexyl-OH} \xrightarrow{\text{TBDMSCl, Imidazole}} \text{Cyclohexyl-O-Si-C-\text{CH}_3} \]

- **Example 2:**
  \[ \text{1,2-Dimethanol} \xrightarrow{\text{TBDMSCl (1 equiv), Imidazole}} \text{1,2-Dimethanol-OTBDMS} \]
Protecting Groups for Alcohols
(Silyl Protecting Groups)

Cleavage

**Deprotection of Silicon-Based Protecting Groups**

\[
\begin{align*}
R-O-Si-Et & + H^+ \rightarrow R-O^- + Et-Si-F \\
R-O-Si^- & \rightarrow R-O^- + Et-Si-F \\
R-O^- & + H^+ \rightarrow R-OH
\end{align*}
\]

Fluoride sources:
- Tetrabutylammonium fluoride, Bu_4N^+F^- (TBAF)
- Pyridine-HF
- Hydrofluoric acid (HF)
- Ammonium fluoride NH_4^+F^-
Protecting Groups for Alcohols (Silyl Protecting Groups)

Synthetic Applications of Silyl Protecting Groups

The bulkiness of TBDMS and TBDPS ether protecting groups can be used to advantage to suppress hydrogen-bonding to the oxygen restricting any incoming reagents to approach from the least hindered side of the molecule.
Protecting Groups for Alcohols
(Silyl Protecting Groups)

Synthetic Applications of Silyl Protecting Groups

The bulkiness of TBDMS and TBDPS ether protecting groups can also be exploited in incorporating the protecting group on less sterically encumbered primary hydroxyl groups selectively using sub-molar amounts of the silyl chloride.

\[
\begin{align*}
\text{CH}_3\text{-}
\begin{array}{c}
\text{OH} \\
\text{CH}_2
\end{array}
\begin{array}{c}
\text{OH} \quad \text{TBDMSCl (1 equivalent)} \\
\text{Imidazole} \quad \text{PCC}
\end{array}
\text{CH}_3\text{-}
\begin{array}{c}
\text{OH} \\
\text{OTBDMS}
\end{array}
\text{CH}_3\text{-}
\begin{array}{c}
\text{K} \\
\text{O}
\end{array}
\begin{array}{c}
\text{OH} \quad \text{TBAF}
\end{array}
\text{CH}_3\text{-}
\begin{array}{c}
\text{O} \\
\text{OTBDMS}
\end{array}
\end{align*}
\]
Protecting Groups for Alcohols
(Benzyl ether Protecting Groups)

Rarely are alkyl ethers used as protecting groups for alcohols, but benzyl ethers are special.

\[ \text{Benzyl ether} \quad \text{(Bn)} \]

**Formation**

\[ \text{R-O} \quad \text{Ph} \]

\[ \text{R-O} \quad \text{Ph} \quad \text{or} \quad \text{R-OBn} \]

\[ \text{R-OH} \quad \xrightarrow{\text{NaH}} \quad \text{PhCH}_2\text{Br (BnBr)} \]

**Cleavage**

Hydrogenolysis is selectively used to cleave benzyl ether protecting groups

\[ \text{R-OCH}_2\text{Ph} \quad \xrightarrow{\text{H}_2} \quad \text{R-OH} \quad + \quad \text{PhCH}_3 \]

\[ \text{R-OCH}_2\text{Ph} \quad \xrightarrow{\text{Pd/C}} \quad \text{R-OH} \quad + \quad \text{PhCH}_3 \]
Protecting Groups for Alcohols
(Cyclic Acetal Protecting Groups)

Acetonide Protecting Groups for 1,2-Diols

Formation

\[
\begin{align*}
\text{R-OH} + \text{O} &= \text{p-TsOH} \\
\text{R-OH} &\rightarrow \text{R-O-R} + \text{H}_2\text{O}
\end{align*}
\]

Other sources of the protecting group:

\[
\begin{align*}
\text{OCH}_3 & \quad \text{OCH}_3 \\
\begin{array}{c}
\text{OCH}_3 \\
\text{OCH}_3
\end{array} & \quad \text{2,2-Dimethoxypropane}
\end{align*}
\]

Cleavage

\[
\begin{align*}
\text{R-O-R} &\rightarrow \text{Conditions} \\
\text{R-OH} &\rightarrow \text{R-OH} + \text{O} = \text{R-O-R}
\end{align*}
\]

Protecting Groups for Aldehydes and Ketones
(Acetal and Ketal Protecting Groups)

**Acetal Protecting Group**

**Formation**

\[
\text{RCHO} + \text{HO-CH}_2\text{-OH} \xrightarrow{p-\text{TsOH}} \text{RCH(O)OCH}_2\text{R} + \text{H}_2\text{O}
\]

**Cleavage**

Acid catalysed hydrolysis (dilute HCl or AcOH / H\text{2}O or TFA/ H\text{2}O or \text{p-TsOH} in acetone) can be used.

\[
\text{RCH(O)OCH}_2\text{R} + \text{H}_2\text{O} \xrightarrow{\text{AcOH Reflux}} \text{RCHO} + \text{HO-CH}_2\text{-OH}
\]
Protecting Groups for Aldehydes & Ketones
(Acetal and Ketal Protecting Groups)

Synthetic Applications of the Acetal Protecting Group

The Wieland-Miescher ketone is a common intermediate in the synthesis of both natural and synthetic steroids.

Because of resonance stabilization, the carbonyl of the α,β-unsaturated ketone is less electrophilic and therefore less reactive to nucleophiles compared to an isolated ketone.
Protecting Groups for Carboxylic Acids
(Esters)

\[
\text{Acidic proton can be abstracted by bases including organometallic reagents}
\]

The common ester protecting groups for carboxylic acids are methyl, ethyl and benzyl esters.

**Methyl Esters**

**Formation**

\[
R-CO_2H + H_2C=\text{N}_2 \rightarrow R-CO_2\text{CH}_3 + \text{N}_2
\]

Diazomethane

**Cleavage**

\[
R-CO_2\text{CH}_3 \xrightarrow{\text{LiOH}} \rightarrow R-CO_2H + \text{CH}_3\text{OH}
\]

\[
R-CO_2\text{CH}_3 \xrightarrow{\text{H}_2\text{O}_2} \rightarrow R-CO_2H + \text{CH}_3\text{OH}
\]
Protecting Groups for Carboxylic Acids

(Esters)

Ethyl and benzyl esters are prepared based on the following rationale:

$$\text{R-CO}_2\text{H} + \text{R'OH} + \text{HCl} \rightarrow \text{R-C-OR'} + \text{H}_2\text{O}$$

Fischer Esterification: Incompatible with α-enolizable carboxylic acids and other acid-labile protecting groups that may be already present in the polyfunctional molecule.

Best approach:

Milder conditions for esterification

$$\text{R-CO}_2\text{H} + \text{R'OH} + \text{DCC} \rightarrow \text{R-C-OR'} + \text{DCHU}$$

DCC = 1,3-Dicyclohexyl carbodiimide

Other Coupling Reagents other than DCC

EDC.HCl

$$\text{EDC.HCl} \equiv \text{Cl} \quad \text{N} \quad \text{N=C=N-CH}_2\text{CH}_3 \quad \text{Water-soluble carbodiimide}$$

EDC = 1-[(3-Dimethylamino)propyl]-3-ethyl carbodiimide hydrochloride

EDC.HCl is more expensive, but the urea by-product derived from it is water soluble and simplifies the purification process.
Protecting Groups for Carboxylic Acids (Esters)

Mechanism of DCC coupling

\[
\text{DCC} + \text{RCOOH} \rightarrow \text{N=C=N} + \text{RCO}^{-}
\]

\[
\text{RCO}^{-} + \text{N=C=N} \rightarrow \text{RCO}^{-} + \text{N=C=N}
\]

\[
\text{R'O}^{-} + \text{N=C=N} \rightarrow \text{RCO}^{-} + \text{N=C=N}
\]

\[
\text{RCOOH} + \text{N=C=N} \rightarrow \text{RCO}^{-} + \text{DCHU}
\]
Protecting Groups for Carboxylic Acids
(Esters)

Ethyl Esters

Formation

\[
R-\text{CO}_2\text{H} \quad + \quad \text{CH}_3\text{CH}_2\text{OH} \quad \xrightarrow{\text{DCC}} \quad R-\text{C}\equiv\text{OCH}_2\text{CH}_3
\]

Cleavage

\[
R-\text{C}\equiv\text{OCH}_2\text{CH}_3 \quad \xrightarrow{\text{LiOH \quad H}_2\text{O}_2} \quad R-\text{CO}_2\text{H} \quad + \quad \text{CH}_3\text{CH}_2\text{OH}
\]
Protecting Groups for Carboxylic Acids
(Esters)

Benzyl Esters

Formation

\[ R-CO_2H + \text{PhCH}_2\text{OH} \xrightarrow{\text{DCC, BnOH}} R-C-O\text{CH}_2\text{Ph} \]

Cleavage

By hydrogenolysis: A very mild method for most functional groups except with alkenes, alkynes and nitriles.

\[ R-C-O\text{CH}_2\text{Ph} \xrightarrow{\text{H}_2, \text{Pd} / \text{C}} R-CO_2\text{H} + \text{PhCH}_3 \]
Protecting Groups for Amino Groups
(Carbamate Protecting Groups)

*Tert-Butyloxy carbonyl Protecting Group (BOC)*

Formation

\[
